Hot weather reducing salmon production, Tasmanian aquaculture company says

By Rosemary Bolger
Posted 26 Feb 2016, 3:46pm

A Tasmanian salmon producer is blaming hot weather for reduced dissolved oxygen levels that are slowing the growth of its fish on the state's west coast.
In its half-yearly report, Huon Aquaculture said a hot summer was putting Macquarie Harbour under additional stress, with oxygen levels in the water falling.
"Huon has responded by reducing feed and installing oxygenating systems to limit the impact of the degrading environment on its fish," the statement said.

ABC NEWS: Tasmanian salmon producer says hot weather is slowing production.

Evidence of climate change: Australian fish feeling the heat

Climate change impacts on fisheries & aquaculture

- Changing habitat distributions
- Changes in growth rates
- Altered migration timing and routes
- Altered food availability
- Changes in spawning
- Reduced number and quality of offspring
- Altered swimming performance
- Disease risk

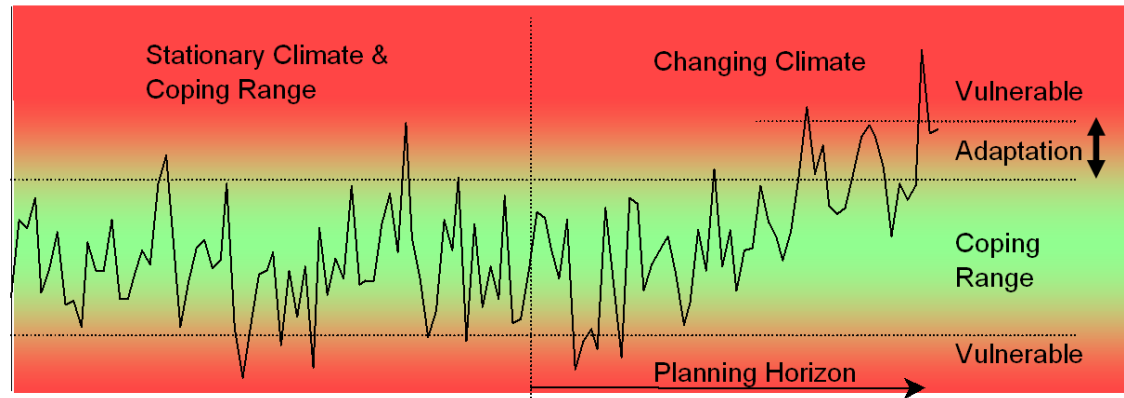

Climate variability vs climate change

In marine management & industries, coping with climate variability is often “business as usual” ...

Coping with climate variability is responsive adaptation
Cost effective? Efficient? Opportunity?

Climate change is a new factor
Can it be managed as for climate variability?

Anticipating climate variability & change is proactive adaptation

Australian Government
Bureau of Meteorology

Management decision timescales

Time

Weather timescales: 1-7 days

Minimal warning time

Reactive management

Seasonal timescales: 2 weeks-9 months

Early window for implementation of strategies to minimise impacts and maximise opportunities

Climate forecasting: 10 – 100s years

Long term planning

Seasonal timescale most useful for proactive management.
Business performance and industry resilience could be improved with predictions about future conditions.

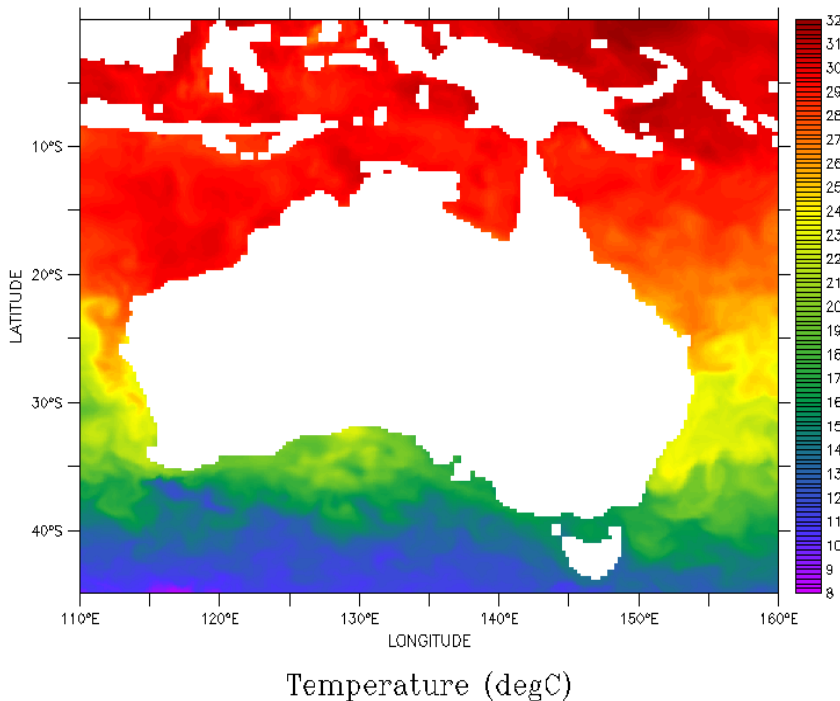

ACCESS-S

Australian Community Climate & Earth System Simulator - Seasonal

DEPTH (m) : 0.5058
TIME : 01-MAY-1996 12:00

DATA SET: cplhco.1d.mersea.grid_T_regular

- ACCESS-S1 replaces POAMA as Bureau operational system in 2017
- UKMO collaboration
- Dynamical global coupled ocean-atmosphere model
- Ocean grid 25km x 25km
- Assimilates satellite & *in situ* SST, *in situ* T&S profiles, altimetry & satellite sea ice
- ACCESS-S2 operational 2019

Seasonal forecast product development

Essential ingredients:

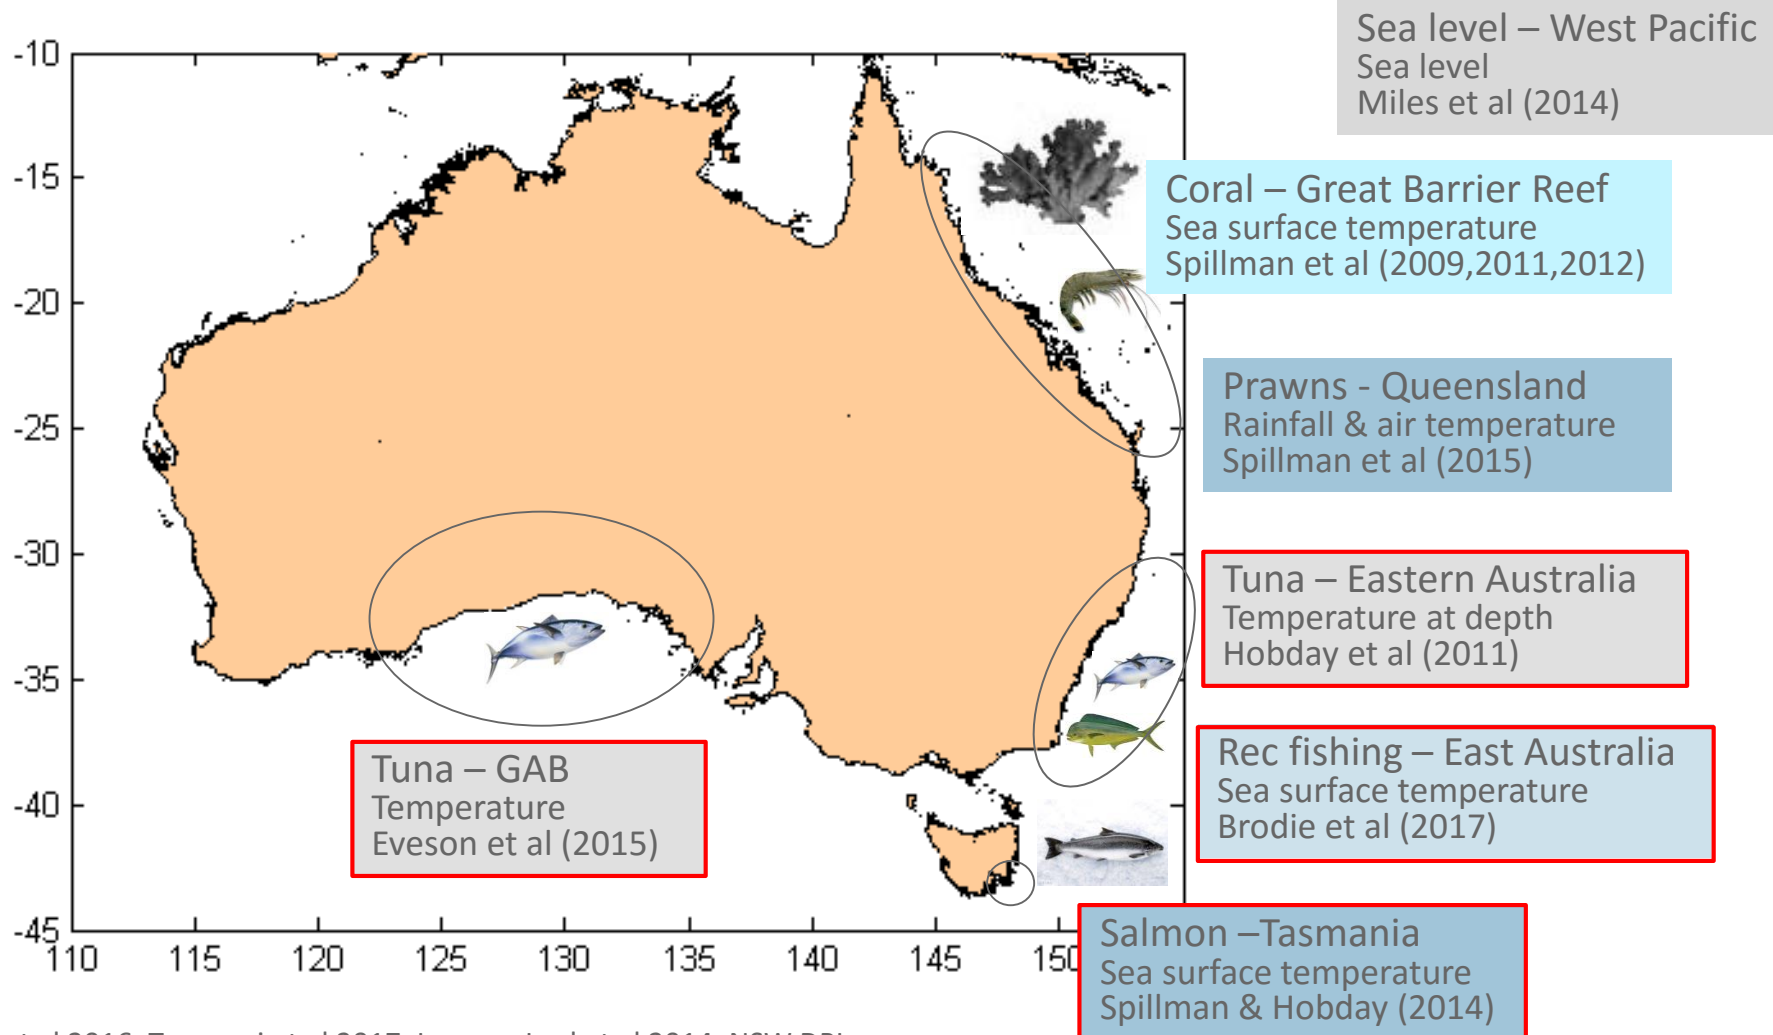

- Strong industry engagement
- Clear understanding of user issues, skills & requirements
- Skilful model forecasts
- Appropriate forecast delivery
- Ocean & fish observations

Critical information:

- What management decisions are made and when?
- Spatial & temporal scales?
- Variable of interest?
- Minimum skill level required?
- Level of operational support?

Marine seasonal forecasting applications

Summer ocean temp (Oct-May)

Brodie et al (2017)

Dolphinfish distribution trial forecast products

- Geographic spatial forecasts of dolphinfish habitat (fish km⁻²)
- Latitudinal summary identifying the location of fish density peaks

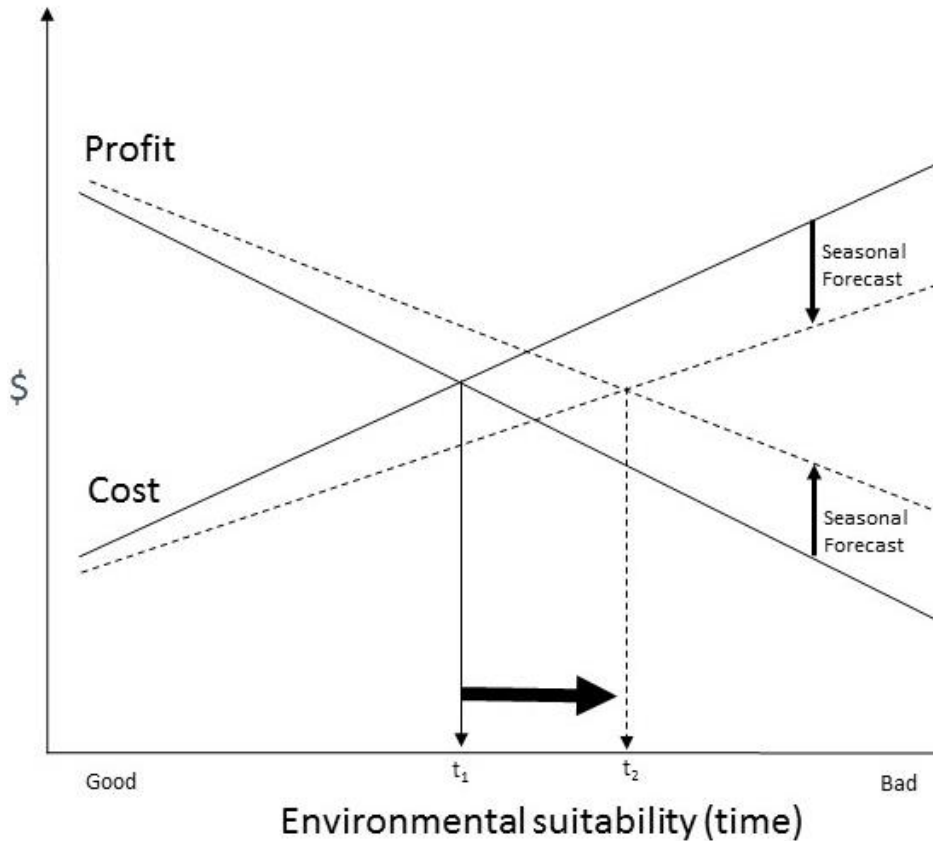

Monthly forecast reports

Assisted FAD program to identify dolphinfish distribution, & adjust the positions & density of FAD arrays

Using seasonal forecasts to reduce vulnerability

Using seasonal forecasting, businesses should be able to **reduce costs** and **increase profits** (relative to no forecast), such that they can **remain profitable** under less suitable environmental conditions **for longer** (until t_2).

Beyond this point, conditions are such that relocation (or another adaptation option) is necessary.

Australian Government

Bureau of Meteorology

The future will be different..

- Climate change is leading to a future where past experience is of reduced value
- Past patterns will not be repeated: novel combinations of physics, chemistry, and biology
- Dynamical seasonal forecast products valuable tools for proactive marine management
- Improves efficiency and enhances resilience of industry to climate variability and change
